CONCURRENT PRODUCT AND PROCESS DEVELOPMENT

Harley-Davidson recognizes the importance of early involvement of stakeholders in the development of new products and processes. This involvement includes Harley-Davidson’s design engineering, manufacturing, and purchasing organization as well as Harley-Davidson’s suppliers. To facilitate this process, Harley-Davidson built the Product Development Center (PDC). The PDC houses the engineering and purchasing functional areas that support the development of new production vehicles. Also present in the PDC are selected strategic OE suppliers and some of the support functions for those residents of the PDC.

Some of the benefits of early involvement of stakeholders in the product development process include:

- Developing products that meet/exceed customer expectations
- Shorter time to market for new products
- Improved reliability of products and processes
- Reduced overall product cost
- Greater accessibility to new technologies

To provide for a more effective and efficient product development process, Harley-Davidson has developed the Concurrent Product and Process Delivery Methodology (CPPDM). The CPPDM is to be followed for both new motorcycles and/or powertrains, as well as for model year changes to OE systems, subsystems and components on existing motorcycles. Running engineering changes to OE motorcycles will use a different methodology that is more suitable to that particular business need.

Although P&A and General Merchandise (GM) do not follow the OE version of CPPDM, they do use a concurrent product development process that is similar in intent. The differences in the methodology are primarily due to a need for a shorter product development cycle that is driven by the shorter life cycles of P&A accessories and GM products. Suppliers providing products to P&A and GM should contact the appropriate purchasing representative for further information regarding the concurrent product development process for P&A and GM products. A detailed process flowchart depicting the new product introduction process followed by P&A is included on the last two pages of this section.

This section of the “Doing Business With Harley-Davidson” manual will not go into the specific details of the CPPDM. However, an illustration of the basic phases of the CPPDM is included on the next page. There are also CPPDM training sessions conducted twice a year to provide suppliers and Harley-Davidson personnel the opportunity to gain a greater understanding of the methodology. More detailed documentation is also available to suppliers. Further information on CPPDM can be obtained from Harley-Davidson Development Purchasing.
Harley-Davidson Motor Company
Concurrent Product and Process Delivery Methodology

Phase 0
Idea Described

Phase 1
Definition Complete, Feasibility Demonstrated

Phase 2
Design, Development, Vehicle Integration Complete and Parts Authorized

Phase 3
PPAP Complete, Equipment, Tooling, and Processes Ready, FPE Vehicle Built

Phase 4
Launch Enterprise Wide

Note: Each phase and corresponding overlaps of phases vary in duration according to the complexity of the individual phase. This illustration is for conceptual purposes only.
P&A New Product Introduction (continued)

Note: All steps may not be required. The steps in this procedure may be performed other than in the order listed.

Service Parts originally ordered by Original Equipment (OE) Purchasing do not apply to this process.
